Media generated by Citizens’ Climate Lobby, July 1 – Oct. 27

Every day, Citizens’ Climate Lobby volunteers generate media in newspapers and online publications throughout the United States. How much media? Quite a lot.

In 2014, CCL generated…

This report highlights three of our media campaigns over the last 4 months:

2. Publication of op-ed from CCL Executive Director Mark Reynolds, Everything you think you know about Republicans and climate change is wrong.
3. Publication of op-ed co-authored by Mark Reynolds and former Congressman Bob Inglis (R-SC), There’s a better response to EPA climate rules besides ‘Just say no.’

Editorial endorsement

Many of our 252 CCL chapters throughout the U.S. have met with the editorial boards of their local newspapers to seek endorsements for our Carbon Fee and Dividend proposal. They develop a relationship with a member of the editorial board and from time to time pitch our media packets whenever climate change is in the news. When the Gibson resolution was introduced in the House, we prepared a media packet that our volunteers pitched to local newspapers. On the following page is a reproduction of an editorial published on October 11 in the Santa Rosa Press Democrat.
PD EDITORIAL:

Time to consider a tax on carbon

For all the disarray of the GOP leadership in Washington, one recent partisan breakthrough should not be overlooked. Last month, 10 House Republicans broke ranks and came together on a resolution acknowledging that climate change is real and calling on Congress to work toward solutions.

The timing couldn't have been better. It came just weeks before the arrival of Pope Francis who, in raising his own concerns about climate change, had already made a plea for "a new dialogue about how we are shaping the future of our planet."

Here's something to contribute to that dialogue. If we're to get serious about lowering carbon emissions and encouraging the purchase of cleaner sources of energy, there's one step to consider, one that even many conservatives are supporting. The adoption of a carbon tax.

The system is far less complex than cap and trade with the likelihood of having a far greater impact. The simple idea is to require fossil fuel companies to pay a fee on the CO2 content of the fuels they extract.

Why support that? Isn't this just an opportunity to give taxpayer money away for pet projects by lawmakers? No. The key is that the money would go directly to taxpayers through monthly dividend checks. Economists for the group Citizens Climate Lobby, which is pushing for adoption of such a system, have projected that checks for a family of four would be $220 a month by 2021, rising to $397 per month by 2035. Yes, the fee on fossil fuels would drive up the cost of energy, but the checks would make up the difference — and then some.

Under the carbon tax, roughly two-thirds of U.S. households would come out ahead. Most of those who would not are wealthy individuals who have large carbon footprints due to air travel and other factors, projections show. They aren't going to make much of a dent in their bills and carbon footprints by buying hybrids either.

But here's the most important dividend. This approach, known officially as the carbon fee and dividend system, would reduce the nation's emissions 52 percent below 1990 levels within 21 years. That's far greater than reductions envisioned by other plans, including legislation signed by Gov. Jerry Brown last week that sets a goal for California of generating half of its electricity from renewable sources by 2030. That's good, but it did not go far enough. A provision of SB 350 called for cutting gasoline use in half. But that was removed from the bill amid opposition from oil companies.

A sure way to get oil companies to understand the importance of reducing carbon emissions is to charge them at the source. To ensure this system does not put American companies at a competitive disadvantage, the carbon fee and dividend system would include for border tariffs on products imported to the U.S. The tariffs would be based on the product's CO2 emissions. But they would only apply if the imports come from a country that does not have a similar system in place.

As former Secretary of State George Shultz wrote earlier this year in endorsing a carbon tax, "Let's level the playing field for competing sources of energy so that costs imposed on the community are borne by the sources of energy that create them, most particularly carbon dioxide."

As the nation grapples with more complex ways of confronting climate change, this is a simple idea that should be part of the conversation.
On Sept. 17, Rep. Chris Gibson (R-NY) and 10 of his Republican colleagues introduced a resolution affirming that climate change is having a severe impact and urging the House of Representatives to work on solutions to the problem.

Since then, Citizens' Climate Lobby volunteers throughout the U.S. have published letters to the editor and op-eds and also generated articles and editorials in newspapers around the country referencing the Gibson resolution.

Below is a list of the media generated, followed by a sampling of publications.

**EDITORIALS**

- **SANTA ROSA PRESS DEMOCRAT**, Oct. 11, 2015: Time to consider a tax on carbon
- **WINDHAM (NY) JOURNAL**: Sept. 23: Gibson has the right idea
- **COLUMBIA PAPER**, Ghent, NY, Sept. 24, 2015: Mr. Gibson stirs up Washington

RADIO
WAMC, Albany, Sept 10, 2015: Gibson, 10 Republicans support action on climate change

Sampling of Gibson media

The following two pages contain reproductions of an op-ed and two letters to the editor that were generated in our media campaign on the Gibson resolution.
By Madelein Para and Michael Arney

In stepping down from his presidential bid last week, Gov. Scott Walker expressed his hope that “a positive conservative message (would) rise to the top of the field” (Journal Sentinel, Sept. 21). Walker was of course referring to one of his former rivals (presumably one other than Donald Trump).

There is another "positive conservative message" we would ardently love to see "rise to the top." It is a resolution by Rep. Chris Gibson (R-N.Y.) and 10 fellow House Republicans to address climate change.

Gibson’s resolution frames itself more broadly as a call for "conservative environmental stewardship." The 11 co-sponsors commit to "economically viable, and broadly supported private and public solutions to study and address the causes and effects of measured changes to our global and regional climates" (HR 424). From members of a party that has resisted action on climate so vigorously, this is a huge step.

Not coincidentally, Gibson introduced his resolution the week before Pope Francis would address the Congress. Gibson and seven of the other sponsors are Catholic. Archbishop Thomas Wenski of Miami called the resolution a "positive example for government leaders" in opening up dialogue on climate change. "The U.S. bishops stand united with the Holy Father in his call to protect creation and our common home for the well-being of current and future generations."

Francis recognizes what many scientists have said: Human activity, notably the burning of fossil fuels, is changing the climate system in ways we do not fully understand and have no way to undo. He sees it as "a global problem with grave implications ...one of the principal challenges facing humanity in our day." But he puts the climate challenge in a context of other environmental, social and spiritual issues we face in the modern world, from water scarcity to unemployment to a lack of inner peace.

Some in Wisconsin are still skeptical that climate change is a true threat. The climate in our state has warmed, but the past few years have been cool. Some of the concerns associated with warming, such as drought, health problems, rising sea levels, food shortages, political instability and migration may seem remote to many Wisconsinites.

Not so for Sister Paul-Mary Draxler (SSND), a Citizens’ Climate Lobby volunteer who now lives in Elm Grove. Sister Paul-Mary spent 10 years on the Kwajalein Atoll in the Pacific Ocean. This remote chain of islands averages 6 feet above sea level. The U.S. military has a major presence there, using small islands for satellite launches, and the wide lagoon as a target for Strategic Defense Initiative rockets from California, more than 5,000 miles away.

Due largely to global climate change, it is expected that much of the atoll will be under water by the end of this century, and 13,500 residents will need a place to go, as will the military operations. For the Defense Department and for those who live or have lived on these islands, climate change is real and calls for urgent action.

Gibson and his colleagues have found a "positive conservative message" in committing to address climate. Leaders of 34 national faith communities, including the president of the National Council of Churches, are encouraging every member of the House to co-sponsor his resolution. We urge all Wisconsin representatives, in particular Catholic Republicans Paul Ryan, Jim Sensenbrenner, and Sean Duffy, to co-sponsor HR 424. It is not policy, but it is a significant recognition of a problem and commitment to leadership.

And as Francis says, "Let us sing as we go. May our struggles and our concern for this planet never take away the joy of our hope."

Madelein Para is the national program director of the Citizens’ Climate Lobby and Michael Arney is the West Milwaukee chapter leader of the Citizens’ Climate Lobby.
LETTER TO THE EDITOR, SEPT. 23, 2015

His efforts should be applauded

This is a shout out to our Congressman, Chris Gibson. He is presenting to Congress a climate change resolution, which takes a foresighted stand to limit the environmental changes that threaten our children and grandchildren.

Representative Gibson, an avowed conservative, said, “Part of being conservative is judicious conservation of resources, both manmade and natural.” He recognizes that climate change is causing tremendous damage to our homes, neighborhoods, businesses and towns, with consequent costs threatening to bankrupt our society.

Gibson acknowledges that human activities have played a part in creating these climatic shifts, and sees that our efforts can alter this trend, and can lead to economic growth for our State and our Nation. His resolution states that, “efforts to mitigate the risks of, prepare for, or otherwise address our changing climate and its effects should not constrain the United States economy.” A fee on carbon would benefit the economy. Such a solution could add 2.8 million jobs over 20 years.

The Gibson resolution offers Congress the opportunity to hit the “reset” button on climate change and engage in a better-informed, more productive conversation. Mr. Gibson’s efforts to create this bipartisan solution should be applauded.

Michael Dimen, Olivebridge

LETTER TO THE EDITOR, SEPT. 26, 2015

Fee on carbon emissions key to action on climate

While too many presidential candidates still avoid climate change, it is refreshing to see Congressman Chris Gibson organize 10 fellow House Republicans, including the Capital Region’s Elise Stefanik, to introduce a resolution recognizing the need for congressional action.

The 11 representatives call for innovative solutions. Here’s one that could end the congressional logjam: Rely on the free market instead of more regulation. If Congress approves a fee on carbon emissions, business will become more energy-efficient and consumers will buy less carbon-based fuel. Further, half of the revenue generated could be used to reduce our corporate tax rate (the highest in the industrialized world) to 25 percent. The balance could be returned to low- and low-and middle-income families to offset their slightly higher energy costs. With this, a border adjustment should be imposed that incentivizes other countries to impose a similar fee to avoid their exporters paying it to us at our border.

More than 40 nations have adopted some form of carbon pricing, covering 22 percent of the world’s greenhouse gas emissions. British Columbia adopted a carbon fee in 2008 that has reduced the per-person consumption of fuels by 16 percent while the rest of that country has risen 3 percent. Meantime, British Columbia’s growth outperforms Canada’s.

Our nonprofit has briefed more than 175 senators and congressmen, or their aides, and found great interest in this kind of bipartisan solution. With Gibson’s and Stefanik’s leadership, our next president, Democrat or Republican, could sign a law pricing carbon that would lead the world in solving the climate challenge.

Op-ed from CCL’s Executive Director

Following CCL’s conference in Washington in June, we distributed an op-ed from Executive Director Mark Reynolds – *Everything you think you know about Republicans and climate change is wrong*. Our volunteers pitched it to newspapers throughout the country, and it was picked up in 40 publications. Below is a reproduction of the op-ed that ran in the Salt Lake Deseret News followed by a list of other publications.

**Deseret News**

OP-ED, JULY 3, 2013

**Everything you think you know about Republicans and climate change is wrong**

By Mark Reynolds

Here’s what we know about climate change: 97 percent of climate scientists are convinced, based upon the evidence, that human-caused global warming is happening.

The popular narrative in the media these days, however, is that Republicans in Congress don’t accept this fact and that the GOP is in denial about the science around climate change.

Well, I have some surprising news: Everything you think you know about Republicans and climate change is a myth that I will now explode.

Our organization, Citizens’ Climate Lobby, recently sent 800 volunteers to meet with more than 500 House and Senate offices in Washington. This was our opening in those meetings:

“We’re here to talk about a policy that can grow the economy, add jobs, increase our competitiveness with China, and make our air and water cleaner.”

That policy, our volunteers would go on to explain, is to place a gradually rising fee on carbon and return the revenue to households. They also shared the results of a nonpartisan study that found such a policy would cut CO2 emissions in half within 20 years, while adding 2.8 million jobs to the economy and saving 13,000 lives annually because of reduced air pollution.

So, what happened when our volunteers engaged Republicans in this conversation?

In most instances, there was keen interest, active listening, productive discussions and — in some cases — expressions of support for our proposal. In very few instances, however, there was pushback from the staff or member of Congress about the science of climate change.

In meeting after meeting with Republican offices, the unspoken agreement seemed to be: “Let’s not argue about the science; let’s talk about solutions and where we might find common ground.”

But what about everything we’re hearing on TV and reading in newspapers about Republican presidential candidates pushing back on the pope’s encyclical? What about a certain member of Congress who tossed a snowball on the Senate floor to dispute global warming?

These are the more sensational reactions that make the news because the media thrives on conflict. No conflict, no news.

Despite the headlines, CCL has found in the past year that the propensity among congressional Republicans to dispute climate science has waned considerably. So, why has that changed and why were we ever arguing the science to begin with?

The answer, I believe, lies with the solutions being proposed, which all involved more government, more red tape and more regulations — things that are anathema to conservatives. Whether it was the 1,600-page cap-and-trade bill that failed to pass the Senate or the current Clean Power Plan to regulate carbon dioxide at electrical plants, Republicans aren’t seeing solutions to climate change they can readily embrace.
Don’t like the solutions? Don’t admit there’s a problem.

But what if there was a solution in harmony with the conservative values of less government and doing things that grow the economy, a market-friendly approach that doesn’t dictate which technologies win or how we should conduct our lives?

Such a solution exists with Carbon Fee and Dividend, the policy I described earlier. By returning all revenue from the carbon fee to households, we accomplish two things: Keep the federal government from getting bigger and add jobs by putting money into the pockets of people who will spend it.

Republicans, by and large, like the sound of that, and a funny thing is happening as our volunteers talk to more and more members of Congress. The conversation is shifting away from the so-called “debate” about climate change and toward finding suitable ways to address the problem.

The premise that Republicans can talk about solving climate change comes as no great shock when you consider the following:

- During his presidency, Theodore Roosevelt protected approximately 230,000,000 acres of public land.
- President Nixon signed the Clean Air Act in 1970.
- Under President Reagan’s leadership, the U.S. entered into the Montreal Protocol, which phased out ozone-depleting chemicals.
- Sen. Susan Collins, R-Maine, was the co-sponsor of the CLEAR Act in 2009, legislation to reduce carbon emissions through a cap-and-dividend system.

So, everything you think you know about Republicans and climate change is, for the most part, wrong. The chance that Republicans will lead on this sooner rather than later has never been more obvious.

And if Republicans are looking for a dramatic moment to lead on climate change, September 24 — the day Pope Francis speaks to Congress — would be the perfect time to introduce a carbon fee and dividend bill.

Mark Reynolds is executive director of the Citizens’ Climate Lobby.

Op-ed from Bob Inglis and Mark Reynolds

When the new EPA climate rules were released this summer, CCL distributed an op-ed co-authored by former Republican Congressman Bob Inglis and CCL Executive Director Mark Reynolds titled, There’s a better response to EPA climate rules besides ‘Just say no.’ CCL volunteers submitted it throughout the U.S., and it was published in 22 newspapers. Below is a reproduction of the op-ed that ran in the Philadelphia Inquirer followed by a list of newspapers that published the piece.

The Philadelphia Inquirer
OP-ED, AUG. 21, 2015

GOP needs alternative climate policy

By Bob Inglis and Mark Reynolds

The Republican talking point on climate change is evolving, thankfully, from "I'm not a scientist" to "Let's solve it through innovation." That's good news for the nation and generations of Americans to come. After all, the first step to solving a problem is to admit that you have one, and that's now happening.

Jeb Bush, the presumptive candidate to beat for the Republican presidential nomination, said last month, "Ultimately, there's going to be a person in a garage somewhere that's going to come up with a disruptive technology that's going to solve these problems, and I think markets need to be respected in this regard."

Another candidate, Carly Fiorina, offered a similar observation: "I think the answer to this problem is innovation, not regulation."

It's a very nuanced position. In one breath, they acknowledge there's a problem we must solve and attack the regulatory solution currently leaving the station. There's just one problem: Suggesting that innovation without market reform will solve climate change is more wishful thinking than a serious policy proposal.

The truth is that we cannot afford to wait for "a person in a garage" to come up with a magic bullet. The technologies that can wean society off polluting fuels already exist. What we need is the economic incentive - money talks - to bring those technologies to scale.

To be sure, there are technologies yet to be invented that will have a game-changing impact on our ability to undo the damage accrued from burning fossil fuels for the past two centuries. But investors are more likely to fund the research and development for these new technologies if they are assured a market that values them and thus a reasonable return on their investment.

What would give them such assurance? A predictable, steadily rising fee for carbon pollution.

For those who worry that pricing carbon will drag down our economy, here's the other part of the equation: Return the revenue from the carbon fee back to the people, either through direct payments or by lowering taxes.

A study by Regional Economic Models Inc. (REMI) looked at this type of policy, factoring in an annual increase of $10 per ton on the carbon dioxide content of fossil fuels. REMI found that after 20 years, emissions would be reduced by 52 percent. More impressive, though, was that the policy would add 2.8 million jobs over 20 years because of the carbon-fee revenue being recycled into the economy.

Leading conservatives like George Shultz, who was secretary of state under President Ronald Reagan, have endorsed this solution, calling it an "insurance policy" against the risk - whatever it may be - posed by climate change.

Now that President Obama has released new Environmental Protection Agency regulations to reduce carbon emissions at power plants, conservatives will step up opposition to a plan they view as big-government overreach. Expect lawsuits, threats of a government shutdown, and heated rhetoric on the presidential campaign trail.

Do opponents really want or need to go down this path?

In previous standoffs, public opinion proved very harsh for the GOP. With opinion polls showing two-thirds of Americans supporting the new EPA rules,
attacking them seems like a strategy that’s all risk and no reward.

The problem is that congressional Republicans haven’t come to the table on the climate issue, and if you’re not at the table, you’re on the menu. By not being engaged, the GOP has ceded climate-change policy to an executive branch that is imposing more government regulations, the least desirable solution Republicans can imagine.

But just saying "no" to EPA regulations is not a viable option, either politically or environmentally. Why not, then, offer an alternative solution that adheres to conservative values? Tell the American people, We have an effective solution that . . .

Uses the power of the free market, rather than the government, to drive both innovation and reductions in greenhouse-gas emissions.

Does not increase the size and control of government.

Protects American businesses and expands the economy.

As Republicans cast about for a new talking point on climate change, the ones who come to the table with a revenue-neutral plan to price carbon will eventually be hailed as visionaries, preservers of a livable world, and saviors of their party.

One of them might even win the White House.

Bob Inglis is a former Republican congressman from South Carolina who now directs republican.org, a think tank promoting free-market energy and climate policies. Mark Reynolds is executive director of Citizens’ Climate Lobby.
